Swarm

Introduction to Docker

Why Docker?

Problems before Docker

Imagine you are a Developer, and you are creating a website on PHP

The Problem

The Problem

Developer

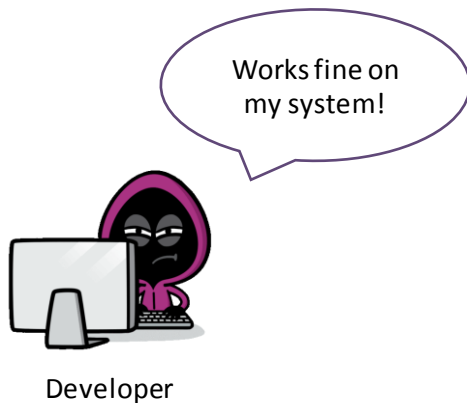

Operations/
Testing

Problems before Docker

Developers used to run the code on their system, it would run perfectly. But the same code did not run on the operations team system.

The Problem

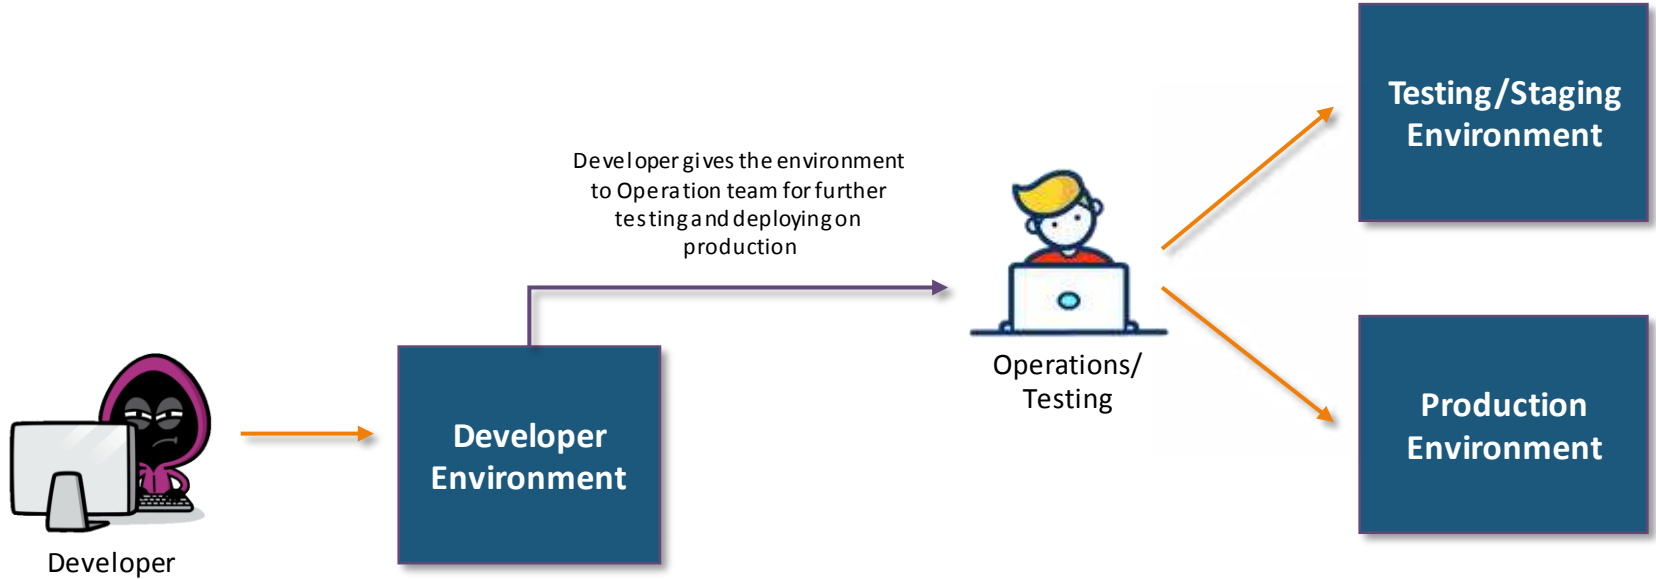

Developer

We needed an entity which can “**contain**” all the software dependencies, and can be ported on to other computers as plug & play package

The Answer

Introduction to Docker

What is Docker?

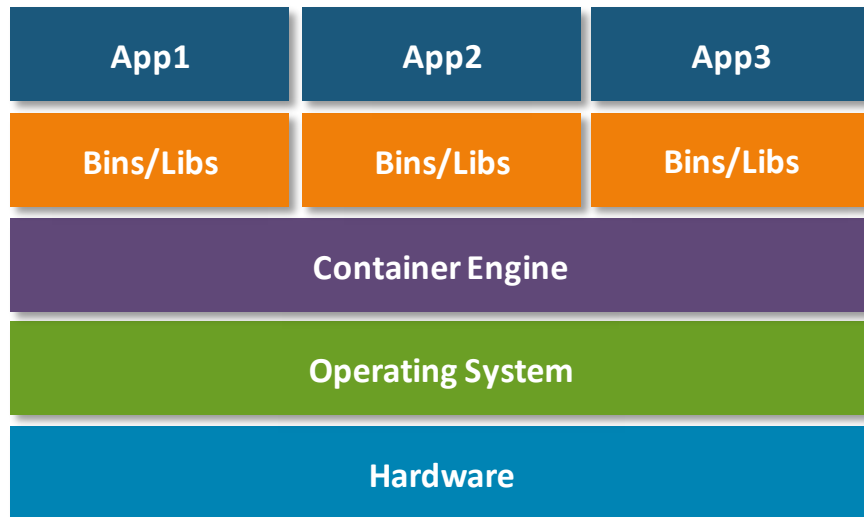

What is Docker?

Docker is a computer program that performs operating-system-level virtualization, also known as "containerization". It was first released in 2013 and is developed by Docker, Inc. Docker is used to run software packages called "containers".

What is Docker?

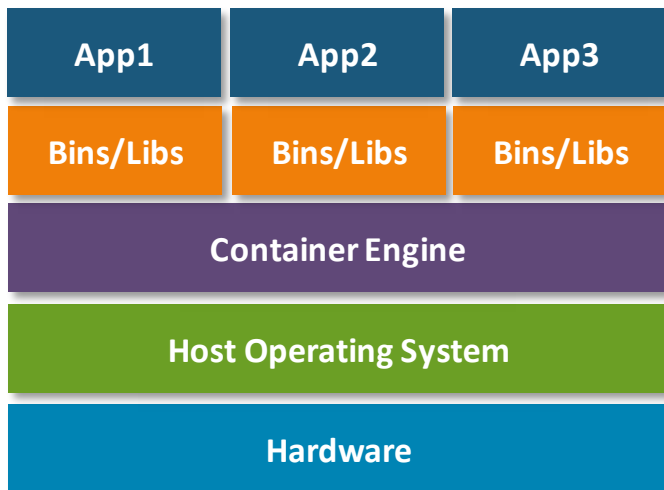

Application **containerization** is an OS-level virtualization method used to deploy and run distributed applications without launching an entire virtual machine (VM) for each app

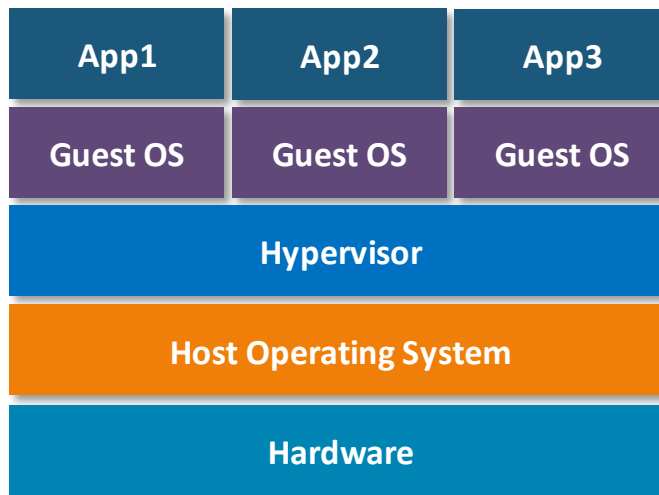

Docker vs Virtual Machine

Docker Architecture

Virtual Machine Architecture

Installation on Ubuntu

One needs to Install Docker Toolbox for Windows, for using Docker

```
sudo apt-get update  
sudo apt-get install docker.io
```

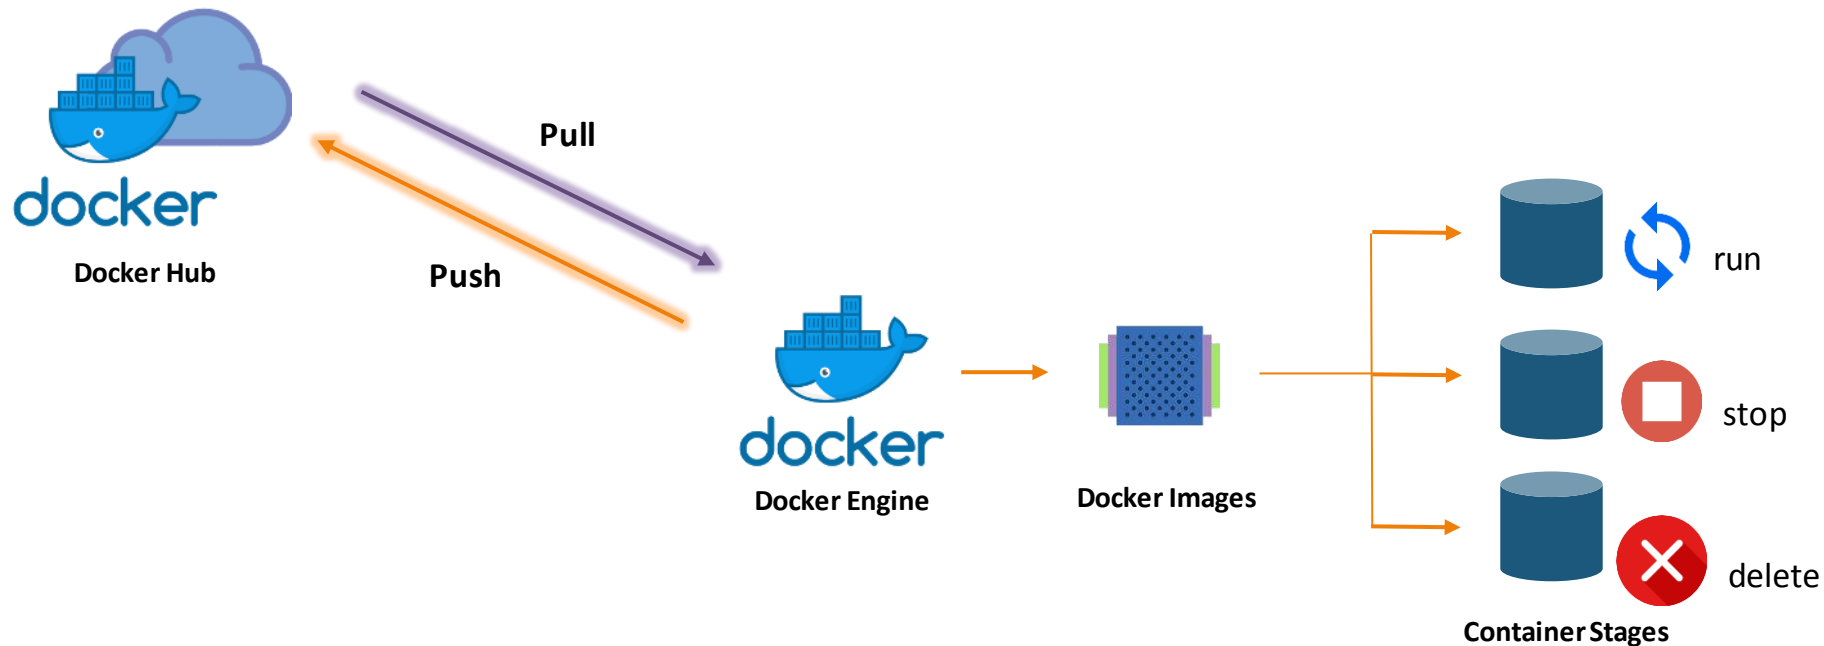

Introduction to Docker

Docker Container Lifecycle

Docker Container Lifecycle

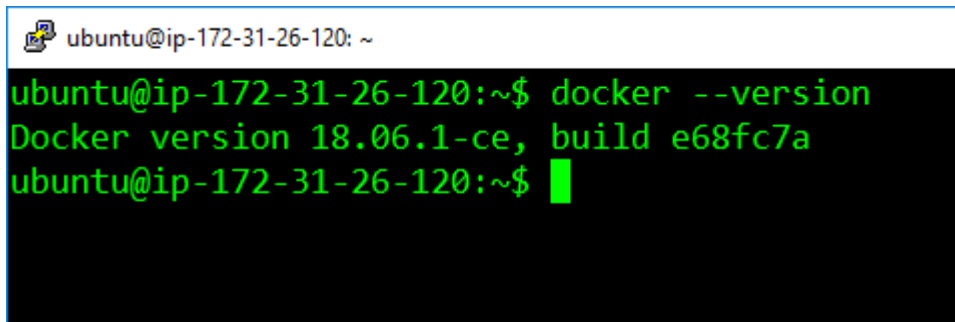

Common Docker Operations

Common Docker Operations

```
docker --version
```

A screenshot of a terminal window with a black background and green text. The prompt is "ubuntu@ip-172-31-26-120: ~". The command "docker --version" has been entered, and the output is "Docker version 18.06.1-ce, build e68fc7a".

```
ubuntu@ip-172-31-26-120: ~  
ubuntu@ip-172-31-26-120:~$ docker --version  
Docker version 18.06.1-ce, build e68fc7a  
ubuntu@ip-172-31-26-120:~$
```

This commands helps you know the installed version of the docker software on your system

Common Docker Operations

```
docker pull <image-name>
```

```
ubuntu@ip-172-31-26-120: ~  
ubuntu@ip-172-31-26-120:~$ docker pull ubuntu  
Using default tag: latest  
latest: Pulling from library/ubuntu  
32802c0cfa4d: Pull complete  
da1315cffa03: Pull complete  
fa83472a3562: Pull complete  
f85999a86bef: Pull complete  
Digest: sha256:6d0e0c26489e33f5a6f0020edface2727db948974  
Status: Downloaded newer image for ubuntu:latest  
ubuntu@ip-172-31-26-120:~$
```

This commands helps you pull images from the central docker repository

Common Docker Operations

docker images

```
ubuntu@ip-172-31-26-120: ~  
ubuntu@ip-172-31-26-120:~$ docker images  
REPOSITORY          TAG                 IMAGE ID  
SIZE  
ubuntu               latest             93fd78260bd1  
86.2MB  
ubuntu@ip-172-31-26-120:~$
```

This command helps you in listing all the docker images, downloaded on your system

Common Docker Operations

```
docker run <image-name>
```

```
ubuntu@ip-172-31-26-120: ~
```

```
ubuntu@ip-172-31-26-120:~$ docker run -it -d ubuntu  
233e926091f338a18d3ba915ad34a6b1bc868642d7f3eb120f91  
ubuntu@ip-172-31-26-120:~$
```

This command helps in running containers, from their image name

Common Docker Operations

`docker ps`

```
ubuntu@ip-172-31-26-120: ~  
ubuntu@ip-172-31-26-120:~$ docker ps  
CONTAINER ID      IMAGE      COMMAND  
STATUS            PORTS      NAMES  
233e926091f3      ubuntu    "/bin/bash"  
Up About a minute  angry_jennings  
ubuntu@ip-172-31-26-120:~$
```

This command helps in listing all the containers which are **running** in the system

Common Docker Operations

```
docker ps -a
```

```
ubuntu@ip-172-31-26-120: ~  
ubuntu@ip-172-31-26-120:~$ docker ps -a  
CONTAINER ID        IMAGE               COMMAND  
STATUS              PORTS              NAMES  
f0a5fa001b0e        ubuntu             "/bin/bash"  
Exited (0) 5 seconds ago          relaxed_clark  
233e926091f3        ubuntu             "/bin/bash"  
Up 4 minutes                angry_jenning  
ubuntu@ip-172-31-26-120:~$
```

If there are any stopped containers, they can be seen by adding the “-a” flag in this command

Common Docker Operations

```
docker exec <container-id>
```

```
root@233e926091f3: /  
ubuntu@ip-172-31-26-120:~$ docker exec -it 233e926091f3 bash  
root@233e926091f3:/#
```

For logging into/accessing the container, one can use the exec command

Common Docker Operations

```
docker stop <container-id>
```

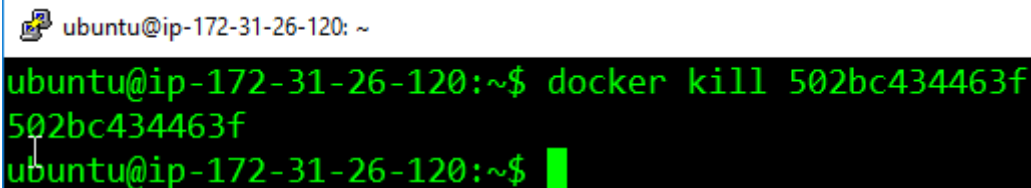

```
ubuntu@ip-172-31-26-120: ~
```

```
ubuntu@ip-172-31-26-120:~$ docker stop 233e926091f3  
233e926091f3  
ubuntu@ip-172-31-26-120:~$ █
```

For stopping a running container, we use the “stop” command

Common Docker Operations

```
docker kill <container-id>
```

```
ubuntu@ip-172-31-26-120: ~  
ubuntu@ip-172-31-26-120:~$ docker kill 502bc434463f  
502bc434463f  
ubuntu@ip-172-31-26-120:~$
```

This command kills the container by stopping its execution immediately. The difference between 'docker kill' and 'docker stop'. 'docker stop' gives the container time to shutdown gracefully, in situations when it is taking too much time for getting the container to stop, one can opt to kill it

Common Docker Operations

```
docker rm <container-id>
```

```
ubuntu@ip-172-31-26-120: ~  
ubuntu@ip-172-31-26-120:~$ docker rm 502bc434463f  
502bc434463f  
ubuntu@ip-172-31-26-120:~$
```

To remove a stopped container from the system, we use the “rm” command

Common Docker Operations

```
docker rmi <image-id>
```

```
ubuntu@ip-172-31-26-120: ~  
ubuntu@ip-172-31-26-120:~$ docker rmi 93fd78260bd1  
Untagged: ubuntu:latest  
Untagged: ubuntu@sha256:6d0e0c26489e33f5a6f0020edface27  
71f23c49  
Deleted: sha256:93fd78260bd1495afb484371928661f63e64be3  
Deleted: sha256:1c8cd755b52d6656df927bc8716ee0905853fad  
Deleted: sha256:9203aabb0b583c3cf927d2caf6ba5b11124b0a2  
Deleted: sha256:32f84095aed5a2e947b12a3813f019fc69f159c  
Deleted: sha256:bc7f4b25d0ae3524466891c41cefc7c6833c533  
ubuntu@ip-172-31-26-120:~$
```

To remove an image from the system we use the command “rmi”

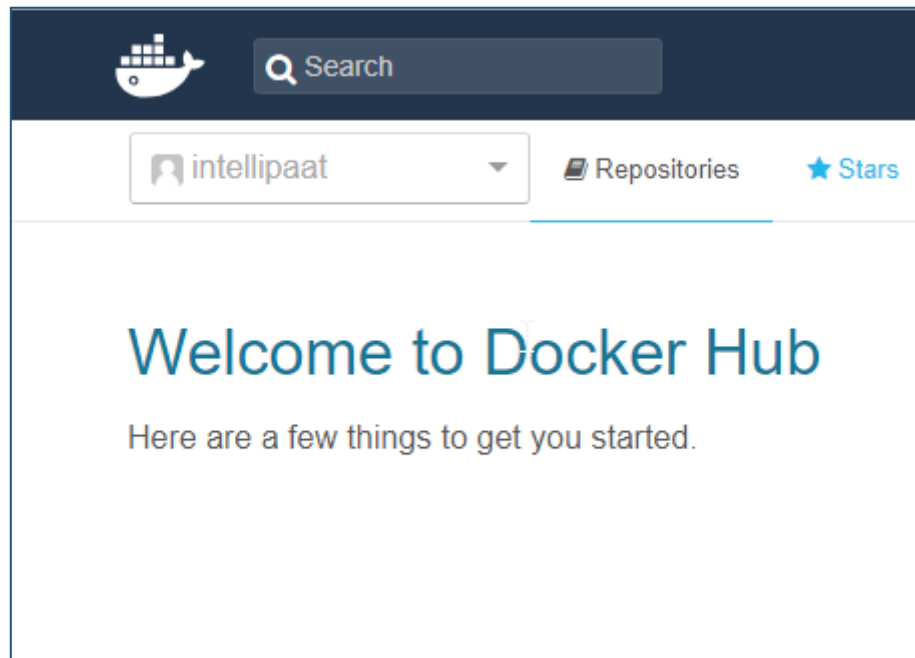

Common Docker Operations

Creating a Docker Hub Account

Creating a Docker Hub Account

1. Navigate to <https://hub.docker.com>
2. Sign up on the website
3. Agree to the terms and conditions
4. Click on Sign up
5. Check your email, and verify your email by clicking the link
6. Finally, login using the credentials you provided on the sign up page

Common Docker Operations

**Saving changes to a
container**

Saving Changes to a Container

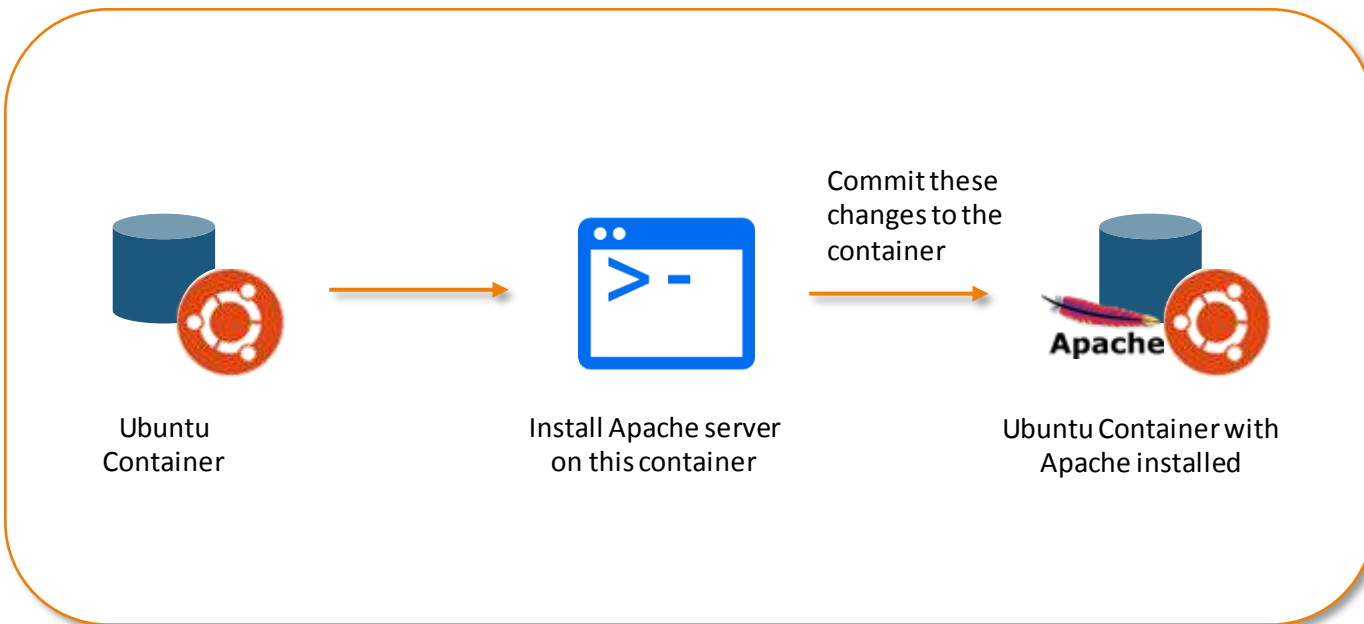

```
docker commit <container-id> <name-for-image>
```

```
[~]$ docker commit b5593da4cc72 new  
sha256:4e5bc9bf0e89471361a5a3f70187c5a3b45b3b04e9875832ea55d3f45b91a6ea  
~$
```

With this command, a new image is created which can be seen under **docker images** with the same name as passed in the command

Saving Changes to a Container

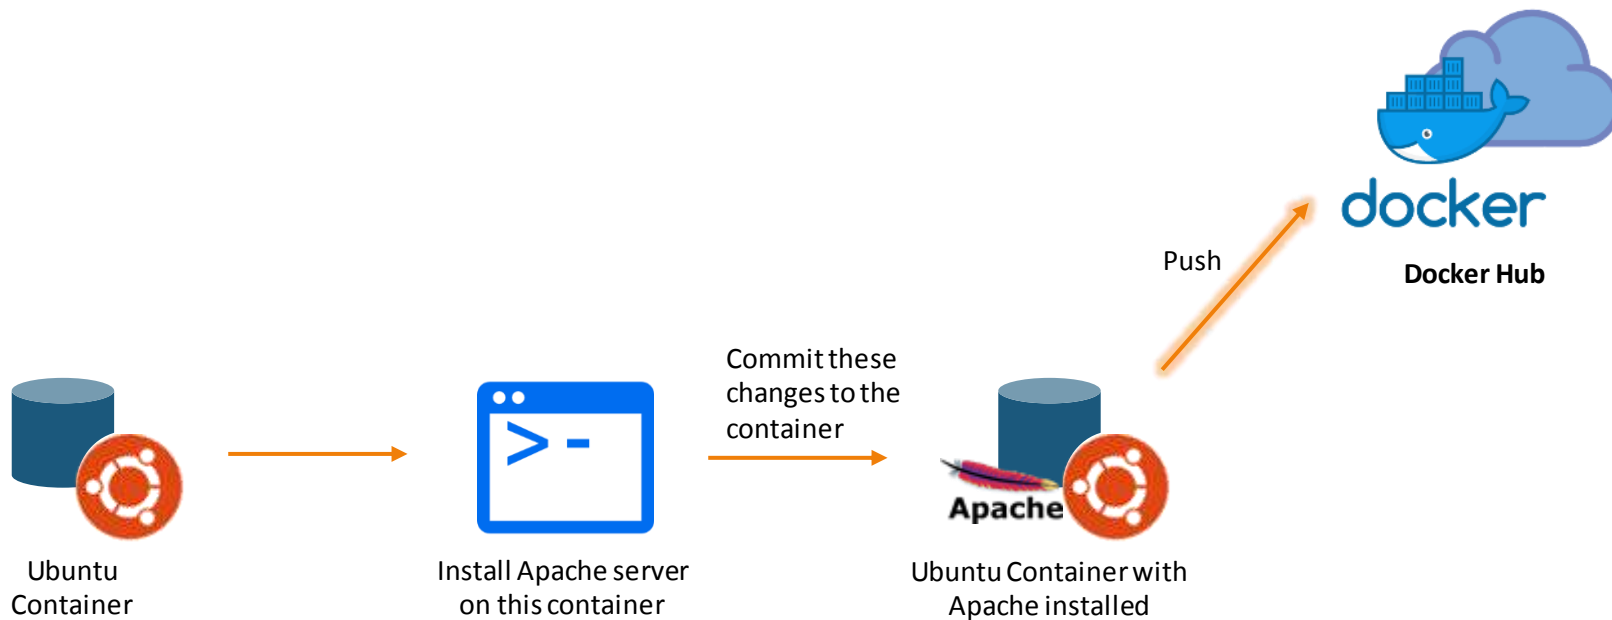

Common Docker Operations

Pushing to DockerHub

Pushing a Container to Docker Hub

**What is a
Dockerfile?**

Introduction to Dockerfile

Introduction to Dockerfile

A **Dockerfile** is a text document that contains all the commands a user could call on the command line to assemble an image. Using **docker** build users can create an automated build that executes several command-line instructions in succession.

Various Commands in Dockerfile

FROM

ADD

RUN

CMD

ENTRYPOINT

ENV

The FROM keyword is used to define the base image, on which we will be building

Example

```
FROM ubuntu
```

Dockerfile

Various Commands in Dockerfile

FROM

ADD

RUN

CMD

ENTRYPOINT

ENV

The ADD keyword is used to add files to the container being built. The syntax which is followed is

ADD <source> <destination in container>

Example

```
FROM ubuntu  
ADD . /var/www/html
```

Dockerfile

Various Commands in Dockerfile

FROM

ADD

RUN

CMD

ENTRYPOINT

ENV

The **RUN** keyword is used to add layers to the base image, by installing components. Each RUN statement, adds a new layer to the docker image

Example

```
FROM ubuntu
RUN apt-get update
RUN apt-get -y install apache2
ADD . /var/www/html
```

Dockerfile

Various Commands in Dockerfile

FROM

ADD

RUN

CMD

ENTRYPOINT

ENV

The **CMD** keyword is used to run commands on the start of the container. These commands run only when there is no argument specified while running the container

Example

```
FROM ubuntu
RUN apt-get update
RUN apt-get -y install apache2
ADD . /var/www/html
CMD apachectl -D FOREGROUND
```

Dockerfile

Various Commands in Dockerfile

FROM

ADD

RUN

CMD

ENTRYPOINT

ENV

The **ENTRYPOINT** keyword is used strictly run commands the moment the container initializes. The difference between CMD and ENTRYPOINT is, ENTRYPOINT will run irrespective of the fact whether argument is specified or not

Example

```
FROM ubuntu
RUN apt-get update
RUN apt-get -y install apache2
ADD . /var/www/html
ENTRYPOINT apachectl -D FOREGROUND
```

Dockerfile

Various Commands in Dockerfile

FROM

ADD

RUN

CMD

ENTRYPOINT

ENV

The ENV keyword is used to define environment variables in the container run-time.

Example

```
FROM ubuntu
RUN apt-get update
RUN apt-get -y install apache2
ADD . /var/www/html
ENTRYPOINT apachectl -D FOREGROUND
ENV name Devops Intellipa
```

Dockerfile

Docker Volumes

Introduction to Docker Volumes

Introduction to Docker Volumes

Docker Volumes are used to persist data across the lifetime of a container.

Creating a Docker Volume

```
docker volume create <name-of-volume>
```

```
~$docker volume create test  
test  
~$
```

Attaching it to a Container

```
docker run -it --mount source=<name-of-volume>,target=<path-to-directory> -d <image-name>
```

```
~$docker run -it --volume source=test,target=/app -d ubuntu
2bc10d68532ea5c186d78197faebd53fd9aa155a2399157d343940d580c88036
~$
```

**Breaking the
Monolith using
Docker**

Microservices

What is a Monolithic Application?

A **Monolithic** application is a single-tiered software application in which different components are combined into a single program which resides in a single platform.

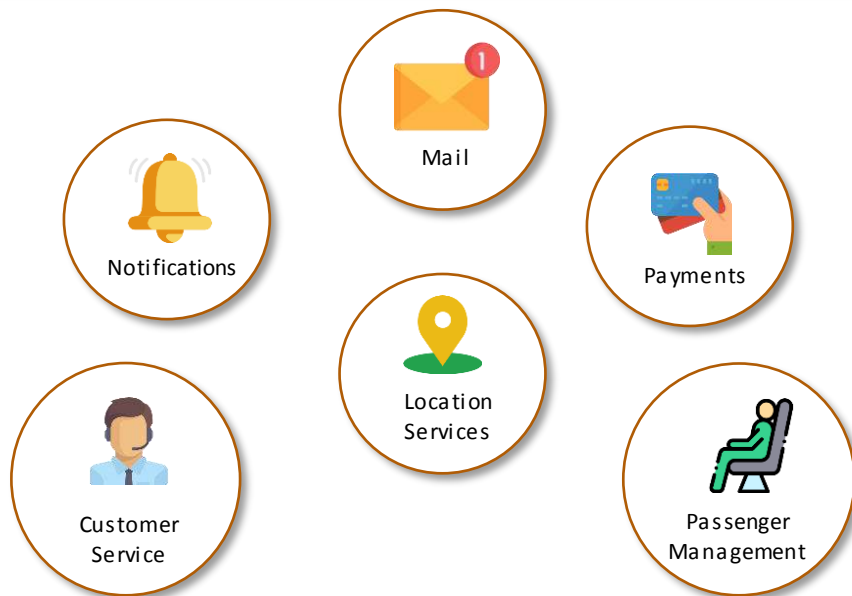

Disadvantages of a Monolithic Application

- ❌ Application is large and complex to understand
- ❌ Entire Application has to re-deployed on an application update
- ❌ Bug in any module, can bring down entire application
- ❌ Has a barrier to adopting new technologies

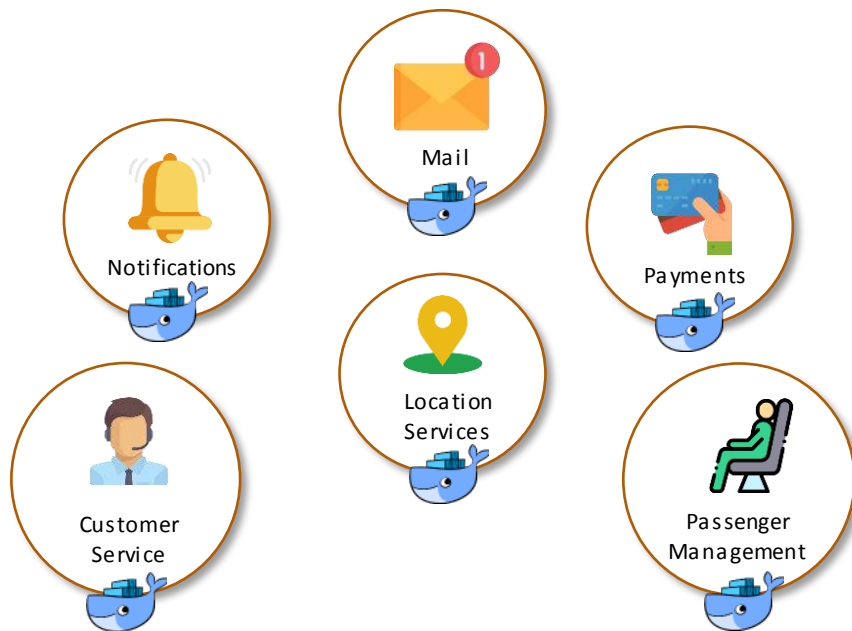

What are Microservices?

Microservices are a software development architectural style that structures an application as a collection of loosely coupled services.

What are Microservices?

Microservices are a software development architectural style that structures an application as a collection of loosely coupled services.

Advantages of Microservices

- ✓ Application is distributed, hence easy to understand
- ✓ The code of only the Microservice which is supposed to be updated is changed
- ✓ Bug in one service, does not affect other services
- ✓ No barrier to any specific technology

What is Docker Compose?

What is Docker Compose?

Compose is a tool for defining and running multi-container **Docker** applications. With **Compose**, you use a YAML file to configure your application's services. Then, with a single command, you create and start all the services from your configuration. Run **docker-compose up** and **compose** starts and runs your entire app.

What is Docker Compose?

Compose is a tool for defining and running multi-container **Docker** applications. With **Compose**, you use a YAML file to configure your application's services. Then, with a single command, you create and start all the services from your configuration. Run **docker-compose up** and **compose** starts and runs your entire app.

Sample Docker Compose File

```
version: '3.3'
services:
  db:
    image: mysql:5.7
    volumes:
      - db_data:/var/lib/mysql
    restart: always
    environment:
      MYSQL_ROOT_PASSWORD: somewordpress
      MYSQL_DATABASE: wordpress
      MYSQL_USER: wordpress
      MYSQL_PASSWORD: wordpress
  wordpress:
    depends_on:
      - db
    image: wordpress:latest
    ports:
      - "8000:80"
    restart: always
    environment:
      WORDPRESS_DB_HOST: db:3306
      WORDPRESS_DB_USER: wordpress
      WORDPRESS_DB_PASSWORD: wordpress
  volumes:
    db_data:
```

docker-compose.yaml

Container Orchestration

**What is Docker
Swarm?**

What is Docker Swarm?

Docker Swarm is a clustering and scheduling tool for **Docker** containers. With **Swarm**, IT administrators and developers can establish and manage a cluster of **Docker** nodes as a single virtual system.

What is Docker Swarm?

Container Orchestration

Creating a Docker Swarm Cluster

Creating a Docker Swarm Cluster

```
docker swarm init --advertise-addr=<ip-address-of-leader>
```

```
ubuntu@ip-172-31-26-120:~/wordpress$ docker swarm init --advertise-addr=172.31.26.120
Swarm initialized: current node (ptde8fg2vbxp8py931vrxdbpp) is now a manager.

To add a worker to this swarm, run the following command:

    docker swarm join --token SWMTKN-1-2m8bntbbysh354anwigivubiqwf21kq6xkww4kijnq
    .26.120:2377

To add a manager to this swarm, run 'docker swarm join-token manager' and follow
ubuntu@ip-172-31-26-120:~/wordpress$
```

This command should be passed on the worker node, to join the docker swarm cluster

Container Orchestration

Deploying an app on Docker Swarm

What is a Service?

Containers on the cluster are deployed using **services** on Docker Swarm. A **service** is a long-running **Docker** container that can be deployed to any node worker.

Creating a Service

```
docker service create --name <name-of-service> --replicas <number-of-replicas> <image-name>
```

```
ubuntu@ip-172-31-26-120:~$ docker service create --name apache --replicas 3 -p 80:80 hshar/webapp
osftoz95rma0dkbsganqk0f3o
overall progress: 3 out of 3 tasks
1/3: running [=====>]
2/3: running [=====>]
3/3: running [=====>]
verify: Service converged
ubuntu@ip-172-31-26-120:~$ █
```

Deploying a Multi Tier App on Docker Swarm

Deploying a Multi Tier app on Docker Swarm

1. Deploy a MySQL service on the Cluster
2. Deploy a website service on this Cluster
3. The MySQL service should not be exposed on the system
4. This will require an Overlay Network. Create an Overlay network
5. Verify if website service can interact with the database service
